

Portfolio Project: Interactive Resume

I want to shelve my Bootstrap project for the time being, and instead work on an interactive resume. I'd like to have three main menu tabs to present my work history, portfolio projects, and personal information. I want to have animated transitions between the tabs, and animated effects to transition from overview data to detailed data. For the work history tab, for example, I'm envisioning corporate logos doing a fly-out animation when the tab is selected, then displaying overview info on mouse hover and detailed information on mouse click. The portfolio and personal info tabs would have similar behavior, with details exposed in a stepwise fashion with lots of animation and graphics.

The page would have routing, state and breadcrumbs for the main menu buttons, and card components for presenting textual data, but the main emphasis of the project would be on animations in response to hover and click events. I would expect use the react-spring library extensively to accomplish the effects that I have in mind.
