Portfolio Project - React:
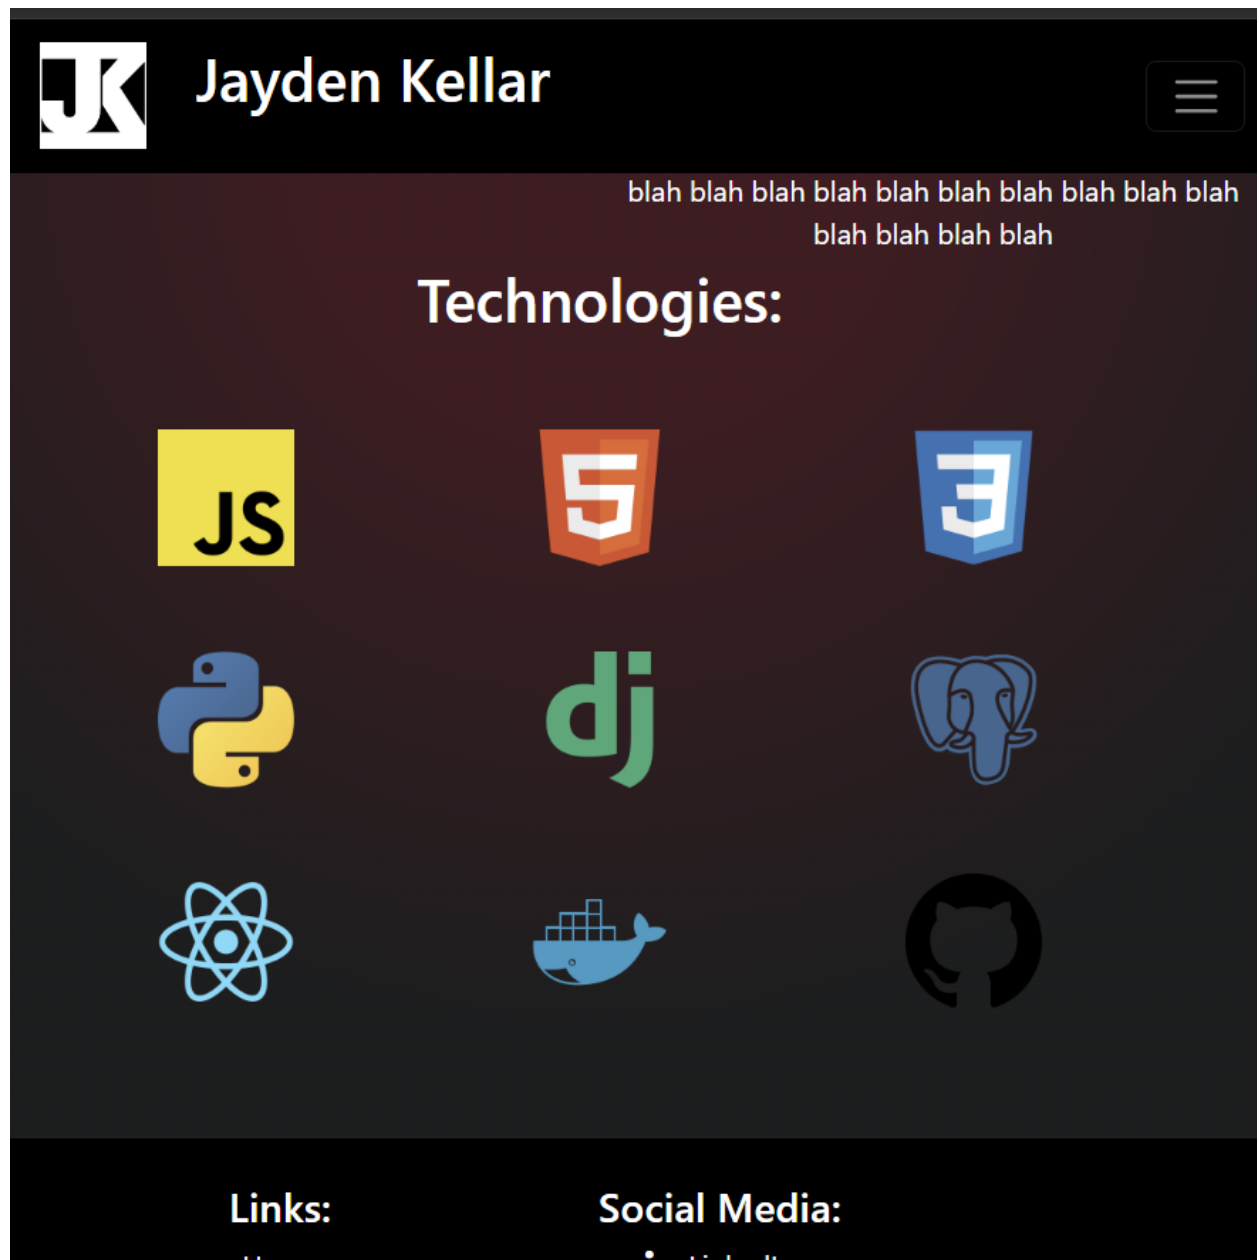

I will be using the react portfolio project as a way to make my personal portfolio website 'jaydenkellar.com". I will be starting fresh for this project, opting not to expand on my devOps+Bootstrap project for the time being.

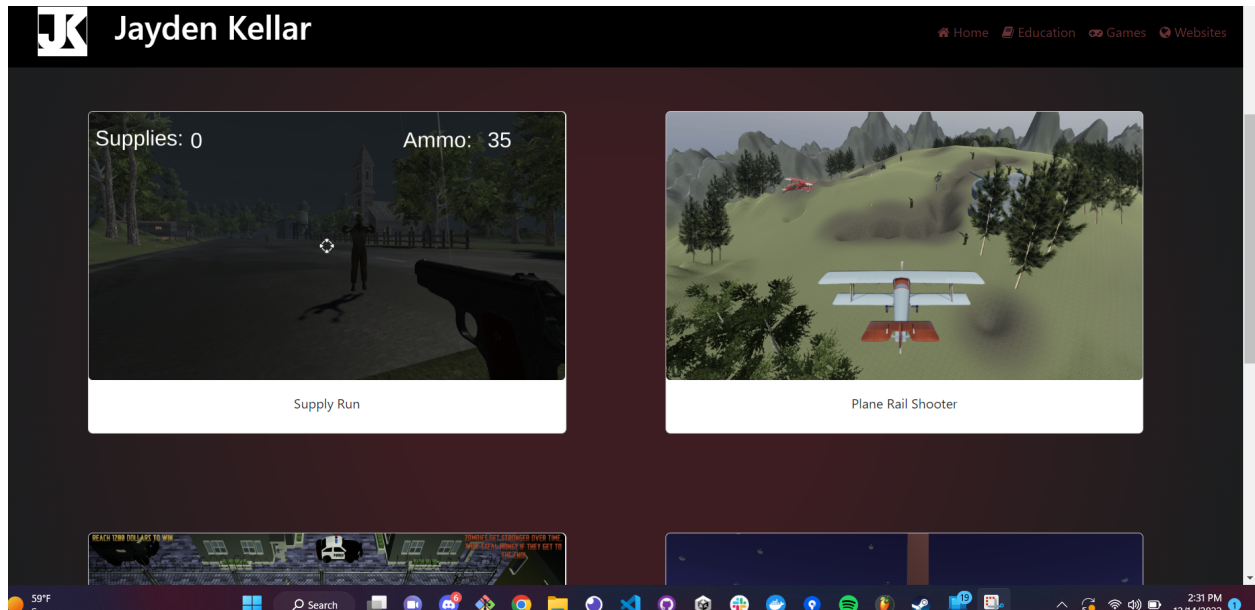

The "certificate browser" will display the certificates I have obtained when clicking on the corresponding school's button. To accomplish this, I used a UseState hook.

For the icons of tech I use, I used Icon scout to find some png icons. I'm using a "getIcons" component that returns every icon object.

I also have a games page where I use cards to display my games, and plan to put a button on them for going to the corresponding itch.io page.

I also will make a page showing off my websites in a similar manner. (haven't started this yet, so I don't have a screenshot)
